

How to Figure the General Service Three Phase Rate

Base Rate

Customer Charge:	\$32.00
Energy Charge:	
The First 2000 KWH	\$0.10634
All Above 2000 KWH	\$0.09138

Example

Suppose you used 14000 KWH.

- 1. Your bill would start with the \$32.00 customer charge.**
- 2. Your first 2000 KWH would be multiplied by \$0.10634, which would be \$212.68.**
- 3. All above 2000 KWH would be multiplied by \$0.09138, which would be \$1096.56.**
- 4. Your base cost would be the total of these charges plus sales tax.**

Tracker

In addition to the base rate charge there is a rate adjustment based upon the cost of purchased power. This can be a positive or negative figure. Because this changes every three months, it is not used in the example. We call this the [tracker](#).
